

About MPS Scar Release Therapy (SRT)

Scar Release Therapy (SRT) is a new therapy technique that applies cellular changing microcurrent stimulation directly through scars, traumas and injuries for the purpose of incredible pain management, fascial release, stress reduction and accelerated tissue healing.

"I had 3 C-sections that cause me discomfort, and experience intermittent shoulder pain. After one scar treatment, the scar is almost invisible and I have no more pain at the scar site or in my shoulder. Truly amazing! M Sherlock LMT

How Scars Hurt us

Scars are universal and take on many forms from surgical, broken bones, sprained joints, torn muscles, inflammation, or any areas that are injured with trauma. Emotional events are also considered scars.

We all accumulate scars and traumas throughout our lives, and they impact our bodies in many negative ways.

The pain and health issues we have in our older years may be directly related to the number and severity of the scars we accumulate over time!

Scars' Negative Influence:

- Chronic Pain
- Activate Stress
- Injure Fascia
- Impede Lymph Flow
- Restrict Functional Movements

To counter Scars' negative influence, the Center For Pain & Stress Research (CPSR) has developed and patented the world's 1st scar reduction, called Scar Release Therapy (SRT).

How MPS Scar Release Therapy Works

MPS Scar Release Therapy (SRT) applies Microcurrent Point stimulation, a patented solution that increases the skin's inter-cellular metabolism, protein synthesis, and healing functioning to reawaken the skin's ability to self-generate.

This simple and discomfort-free procedure is proven to reduce Scar size 20-30% (after a single session), releasing adhesions and fascia restrictions.

Scar Release Therapy is also proven to deliver 73.2 - 80.2% pain relief after a single application. (IJCAM 2017, OGN 2018).

SRT is simple & painless to apply and is highly effective in reducing the negative influences of scars.

After

Benefits of MPS Scar Release Therapy

- Reduce Chronic Pain. SRT is published in science to produce a 73-82% reduction in chronic pain
- Trigger point activation: SRT de-activates distal trigger points 10 times more than local trigger point therapy. Scars control trigger point tenderness.
- Improved Lymph & Circulation: Releasing Scars opens-up lymphatic channels permitting for increased movement of volume & amplitude.
- Improved Functionality: Releasing scars releases fascia, improving body-wide movement.

"I cannot put into words how life altering this treatment was for me."
R Feldhaus PT
